The experimental facts which must be understood are the following: (1) Nickel chemisorbs hydrogen molecules dissociatively down to liquid nitrogen temperature [1]. The reaction is considered to take place with little or no activation energy. (2) Copper which is similar to nickel except that it contains a filled 3rd band does not dissociatively chemisorb hydrogen molecules, although copper strongly absorbs hydrogen atoms [2]. The ability of nickel to dissociatively chemisorb hydrogen is generally ascribed to the unfilled d band of the nickel. The aim of this investigation is to understand the role of the electronic structure of a transitions metal, particularly the d electrons, in determining its catalytic activity.
