

## Podiform Chromite Deposits, Database and Grade and Tonnage Models: Usgs Scientific Investigations Report 2012-5157 (Paperback)

By Dan L Mosier, Donald A Singer

Bibliogov, United States, 2013. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Chromite ((Mg, Fe<sup>++</sup>)(Cr, Al, Fe<sup>+++</sup>)<sub>2</sub>O<sub>4</sub>) is the only source for the metallic element chromium, which is used in the metallurgical, chemical, and refractory industries. Podiform chromite deposits are small magmatic chromite bodies formed in the ultramafic section of an ophiolite complex in the oceanic crust. These deposits have been found in midoceanic ridge, off-ridge, and suprasubduction tectonic settings. Most podiform chromite deposits are found in dunite or peridotite near the contact of the cumulate and tectonite zones in ophiolites. We have identified 1,124 individual podiform chromite deposits, based on a 100-meter spatial rule, and have compiled them in a database. Of these, 619 deposits have been used to create three new grade and tonnage models for podiform chromite deposits. The major podiform chromite model has a median tonnage of 11,000 metric tons and a mean grade of 45 percent Cr<sub>2</sub>O<sub>3</sub>. The minor podiform chromite model has a median tonnage of 100 metric tons and a mean grade of 43 percent Cr<sub>2</sub>O<sub>3</sub>. The banded podiform chromite model has a median tonnage of 650 metric tons and a mean grade...
