Then linear multiple regression can be used to determine the coefficients $b_0, b_1 \dots b_k$ that provide a least-squares fit of equation (43) to the numerical data. Computer programs for linear multiple regression analysis exist in various software packages such as the IMSL statistics library and the SPSS statistics program. This software can solve equation (43) for the unknown coefficients, provide statistics on the expected error of the approximation, and automatically test various combinations of user-supplied functions to allow the user to select the best subset of functions. Although the technique allows for general functions $f_1 (u, e), f_2 (u, e), \dots, f_k (u, e)$, real data suggest that the deviations can be sufficiently represented by a second-order polynomial: (44) and (45) $b_0 b_1 u b_2 e b_3 u^2 b_4 e^2 b_5 u e^2$. CONCLUSIONS In this paper an overview has been presented describing the interrelationships between gear geometry, manufacture, and measurement. A methodology also...
